- PageRank beyond the web

Graph G(E, V), |V| = n, |E| = mAdjacency matrix $A^{n \times n}$, A_{ij} , edge $i \rightarrow j$

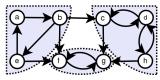

Graph is directed, matrix is non-symmetric: $A^T \neq A$, $A_{ij} \neq A_{ji}$

- sinks: zero out degree nodes, $k_{out}(i) = 0$, absorbing nodes
- sources: zero in degree nodes, $k_{in}(i) = 0$

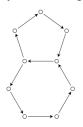

- Graph is strongly connected if every vertex is reachable form every other vertex.
- Strongly connected components are partitions of the graph into subgraphs that are strongly connected

 In strongly connected graphs there is a path is each direction between any two pairs of vertices

image from Wikipedia

• A directed graph is **aperiodic** if the greatest common divisor of the lengths of its cycles is one (there is no integer k > 1 that divides the length of every cycle of the graph)

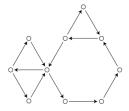

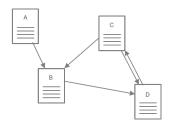

image from Wikipedia

Web as a graph

• Hyperlinks - implicit endorsements

• Web graph - graph of endorsements (sometimes reciprocal)

Random walk

Random walk on a directed graph:

$$p_i^{t+1} = \sum_{j \in N(i)} \frac{p_j^t}{d_j^{out}} = \sum_j \frac{A_{ji}}{d_j^{out}} p_j$$

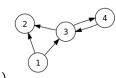

$$D_{ii} = diag\{d_i^{out}\}$$

$$p^{t+1} = (D^{-1}A)^T p^t$$

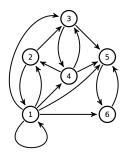

$$P = D^{-1}A$$

Power iterations

$$\mathbf{p}^{t+1} \leftarrow \mathbf{P}^T \mathbf{p}^t$$

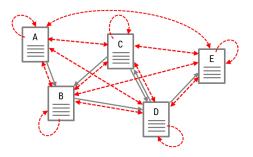

a)

b)

PageRank

"PageRank can be thought of as a model of user behavior. We assume there is a "random surfer" who is given a web page at random and keeps clicking on links, never hitting "back" but eventually gets bored and starts on another random page. The **probability** that the random surfer visits a page is its **PageRank**."

Sergey Brin and Larry Page, 1998

PageRank formulation

Power iterations:

$$\mathbf{p} \leftarrow \alpha \mathbf{P}^T \mathbf{p} + (1 - \alpha) \frac{\mathbf{e}}{\mathbf{n}}, \quad \alpha \text{ - teleportation coefficient}$$

• Sparse linear system:

$$(I - \alpha P^T)p = (1 - \alpha)\frac{e}{n}$$

• Eigenvalue problem ($\lambda = 1$):

$$(\alpha P^T + (1 - \alpha)E) p = \lambda p$$

$$P = D^{-1}A$$

Perron-Frobenius Theorem

Perron-Frobenius theorem (Fundamental Theorem of Markov Chains) If matrix is

- stochastic (non-negative and rows sum up to one, describes Markov chain)
- irreducible (strongly connected graph)
- aperiodic

then

$$\exists \lim_{t \to \infty} \bar{\mathsf{p}}^t = \bar{\pi}$$

and can be found as a left eigenvector

$$ar{\pi}P=\lambdaar{\pi},$$
 where $||ar{\pi}||_1=1,\lambda=1$

 $\bar{\pi}$ - stationary distribution of Markov chain, row vector

Oscar Perron, 1907, Georg Frobenius, 1912.

PageRank variations

Power iterations

$$\begin{aligned} \mathbf{p} \leftarrow \alpha \mathbf{P}^T \mathbf{p} + (1 - \alpha) \mathbf{v}, & \mathbf{v} & \text{- teleportation vector} \\ \mathbf{P}' &= \alpha \mathbf{P} + (1 - \alpha) \mathbf{e} \mathbf{v}^T \\ & \mathbf{p} \leftarrow {\mathbf{P}'}^T \mathbf{p}, \ ||\mathbf{p}|| = 1 \end{aligned}$$

• Topic specific PageRank

v - set of pages on specific topics

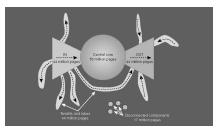

TrustRank

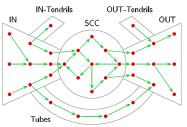

Personalized PageRank

v - set of personal preference pages

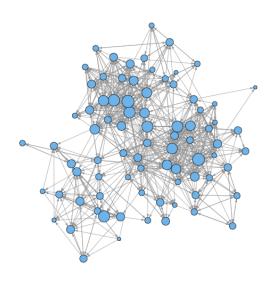

Graph structure of the web

Bow tie structure of the web

Hubs and Authorities (HITS)

Citation networks. Reviews vs original research (authoritative) papers

- authorities, contain useful information, ai
- hubs, contains links to authorities, hi

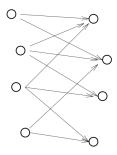

Mutual recursion

Good authorities reffered by good hubs

$$a_i \leftarrow \sum_j A_{ji} h_j$$

 Good hubs point to good authorities

$$h_i \leftarrow \sum_i A_{ij} a_j$$

hubs

authorities

HITS

System of linear equations

$$a = \alpha A^T h$$
$$h = \beta A a$$

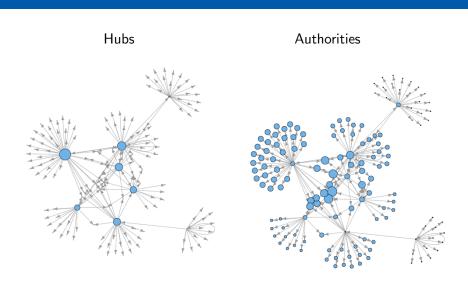

Symmetric eigenvalue problem

$$(A^TA)a = \lambda a$$

 $(AA^T)h = \lambda h$

where eigenvalue $\lambda = (\alpha \beta)^{-1}$
